- Temporary stabilization
- Dewatering
- Concrete Washout
- Good housekeeping

# Let's not forget our mission: Reducing Pollution in Stormwater Runoff

**Sediment runoff rates from construction sites** are typically 10 to 20 times greater than those from agricultural lands, and 1,000 to 2,000 times greater than those of forest lands. During a short period of time, construction activity can contribute more sediment to streams than can be deposited over several decades, causing physical and biological harm to our Nation's waters.

United States Environmental Protection Agency Office of Water (4203) January 2000 (revised December 2006) EPA 833-F-00-013 December 2006 Fact Sheet 3.0

**Stormwater Phase II Final Rule**

**Construction Program**

3.0 - Construction Program Overview

3.1 - Construction Rainfall Erosivity Waiver

**Industrial "No Exposure"**

4.0 - Conditional No Exposure Exclusion for Industrial Activity

The 1972 amendments to the Federal Water Pollution Control Act, later referred to as the Clean Water Act (CWA), prohibit the discharge of any pollutant to navigable waters of the United States from a point source unless the discharge is authorized by a National Pollutant Discharge Elimination System (NPDES) permit. Efforts to improve water quality under the NPDES program traditionally have focused on reducing pollutants in industrial process wastewater and municipal sewage treatment plant discharges. Over time, it has become evident that more diffuse sources of water pollution, such as stormwater runoff from construction sites, are also significant contributors to water quality problems.

Sediment runoff rates from construction sites are typically 10 to 20 times greater than those from agricultural lands, and 1,000 to 2,000 times greater than those of forest lands. During a short period of time, construction activity can contribute more sediment to streams than can be deposited over several decades, causing physical and biological harm to our Nation's waters.

In 1990, EPA promulgated rules establishing Phase I of the NPDES stormwater program. Phase I addresses, among other discharges, discharges from large construction activities disturbing 5 acres or more of land. Phase II of the NPDES stormwater program covers small construction activities disturbing between 1 and 5 acres. Phase II became final on December 8, 1999 and small construction permit applications were due by March 10, 2003 (specific compliance dates will be set by the NPDES permitting authority in each State). This fact sheet outlines the construction activities covered by Phase I and Phase II, including possible waiver options from Phase II coverage, and the Phase II construction program requirements.

**Who Is Covered Under the Phase I Rule?**

**Sites Five Acres and Greater**

The Phase I NPDES stormwater rule identifies eleven categories of industrial activity in the definition of "stormwater discharges associated with industrial activity" that must obtain an NPDES permit. Category (c) of this definition is construction activity, commonly referred to as "large" construction activity. Under category (c), the Phase I rule requires all operators of construction activity *disturbing 5 acres or greater of land* to apply for an NPDES stormwater permit. Operators of sites disturbing less than 5 acres are also required to obtain a permit if their activity is part of a "larger common plan of development or sale" with a planned disturbance of 5 acres or greater. "Disturbance" refers to exposed soil resulting from activities such as clearing, grading, and excavating. Construction activities can include road building, construction of residential houses, office buildings, industrial sites, or demolition.

**What Is Meant by a "Larger Common Plan of Development or Sale"?**

As defined in EPA's NPDES stormwater general permit for construction activity, a "larger common plan of development or sale" means a contiguous area where multiple separate and distinct construction activities are occurring under one plan (e.g., the operator is building on three half-acre lots in a 6-acre development). The "plan" in a common plan of development or sale is broadly defined as any announcement or piece of documentation

## Challenges for Effective Sequencing

### Challenge

- “means and methods”
- Sequencing can be disrupted by disruptions in availability of materials and labor
- Inflexible scheduling
- Cookie cutter sequences

### STORMWATER QUALITY CONSTRUCTION SEQUENCE

The sequence of when each measure will be implemented is summarized below.

- Post signed NOI, NPDES Permit Number, the City Storm Water Permit, contact information for the site and the location where construction plans may be obtained in a visible location at the entrance to the site.
- Construct gravel construction entrance.
- Install silt fence/fiber rolls at the construction limits of the site prior to construction.
- Initiate weekly Self-monitoring program.
- Mass grade the site, with the detention pond being the initial area of work.
- Install pond outlet protection.
- Construct temporary diversion swales where required during construction activity to divert large amounts of runoff are to the storm water pond until the storm water system is installed.
- Install underground utilities.
- Inlet protection as detailed on these plans is to be installed surrounding each inlet/drywell/catch basin until work is completed and protection has been approved for removal.
- All areas are to be permanently seeded and blanketed as soon as possible.
- Temporary seeding shall be placed 14 days after grading is complete or if disturbed ground is intended to be left for a period of more than 14 days.
- Install curb and construct roadway.
- Sediment shall be removed from the detention pond and permanent seeding placed.
- Erosion control features shall be maintained until construction is complete.
- Any temporary erosion control measures are to be removed once permanent vegetative cover has been established.
- Rule 5 Notice of Termination shall be submitted.

See attached details for acceptable erosion and sedimentation control installation methods.

Housekeeping

## Sequencing Solution: Cookie Cutter Sequences

- Discuss in detail during pre-construction meeting
- Make sequence project specific – the contractor can make modifications to the approved SWPPP
- Identify when and how stormwater quality measures will be implemented relative to land-disturbing activities
- Calendar of activities, including phases of project and when stormwater quality measures will be installed

## Sequencing Solution: Phase 3

Phase 3

Roads are paved, final grading of common areas, building construction ongoing

**Sequencing****Stabilization****Dewatering****Concrete  
Washout****Good  
Housekeeping**

## Sequencing Solution: Tips

- Have a plan but be flexible
- Budget for maintenance, contingency
- Have alternative options when BMP is delayed (include alternative in the plan)
- Understand stabilization requirements (7 days) and needs for season and time of the project
- Beware of cookie cutter sequences
  - SWPPP sequencing should be seamless with construction plan
  - If you receive a plan with a cookie cutter sequence, make amendments where appropriate and document changes in the project management log

## Challenges and Solutions: Understanding Temporary Stabilization

### CSGP 3.4 Stabilization Requirements

- (a) Un-vegetated areas that are left idle or scheduled to be left inactive must be temporarily or permanently stabilized with measures appropriate for the season to minimize erosion potential. To meet this requirement the following apply:
- (1) Stabilization must be initiated by the end of the seventh day the area is left idle. The stabilization activity must be completed within fourteen (14) days after initiation. Initiation of stabilization includes, but is not limited to, the seeding and/or planting of the exposed area and applying mulch or other temporary surface stabilization methods where appropriate. Areas that are not accessible due to an unexpected and disruptive event that prevents construction activities are not considered idle.
  - (2) Areas that have been compacted may be excluded from the stabilization requirement when the areas are intended to be impervious surfaces associated with the final land use, provided run-off from the area is directed to appropriate sediment control measures.

## Challenges and Solutions: Understanding Temporary Stabilization

CSGP 3.4 Stabilization Requirements

(a) Un-vegetated areas that are not to be stabilized with measures approved by the permittee shall be stabilized with measures approved by the permittee. To meet this requirement the following apply:

(1) Stabilization must be in place before any earthmoving activity must be completed. This includes, but is not limited to, roads or other temporary surfaces due to an unexpected delay in construction.

must be temporarily or permanently stabilized to prevent erosion potential. To meet this requirement, the permittee shall:

Generally, this can include roadways, building pads, and other impervious surfaces that require compaction.

(2) Areas that have been compacted may be excluded from the stabilization requirement when the areas are intended to be impervious surfaces associated with the final land use, provided run-off from the area is directed to appropriate sediment control measures.

Sequencing

Stabilization

Dewatering

Concrete  
WashoutGood  
Housekeeping

## Challenges and Solutions: Temporary Stabilization Tips

- **Sequencing:** Temporary and permanent stabilization should be included in the sequence,
- **Seed Specifications:** Selection, application methods, mulch protection, locations (e.g. slopes, detention ponds, out lots)
- **Budgeting:** Don't just budget for final stabilization. Consider things like stockpiles, out lots, minor repairs. Be prepared to apply seed/mulch throughout the project
- **Seasonality:** Choose seeds appropriate for the time you are seeding. Prepare for winter, and if you don't get things buttoned up before the seeding window, have a back up plan.
- **Alternatives:** Riprap, proprietary erosion control products can be used as permanent stabilization. Tarping stockpiles or disturbed areas can serve as a quick fix for temporary stabilization.

Sequencing

Stabilization

Housekeeping

## Challenges and Solutions for Dewatering

CSGP 3.3(a)(6) Discharge from dewatering of ground water from excavations, trenches, foundations, etc must not be discharged when:

- (A) Sediment-laden water is not first directed to an appropriate sediment control measure or a series of control measures that minimizes the discharge of the sediment.
- (B) A visible sheen and/or pollutants are present at a level that requires additional treatment and/or an alternate permit.

Sequencing

Stabilization

Dewatering

Concrete  
WashoutGood  
Housekeeping

## Solutions for Dewatering: Required to be Included in SWPPP

### **B9 - Dewatering applications and management methods:**

If dewatering activities are anticipated appropriate measures should be identified and included on the plans. This plan element is primarily associated with activities that include pumping of accumulated water associated with excavated areas.

If dewatering is planned or becomes necessary on site, identify the method or methods that will be used. As part of the plan, it may be useful to specify measures as a contingency in the event dewatering is required. Discharged water must be treated with an appropriate sediment control measure or measures, prior to discharge.

Other measures such as sediment basins and sediment traps or the use of flocculants should be considered components of items (B4) and (B5) above.

Sequencing

Stabilization

Dewatering

Concrete  
WashoutGood  
Housekeeping

## Solutions for Dewatering: Diversions

- Divert clean water, so sediment control is not needed
- Cofferdams, channels, flumes, pump arounds
- Typically used when working in stream
- Divert main channel via cofferdams, temporary channels, flumes, or a pump around

- TEMPORARY PUMP AROUND SEQUENCE**
1. SET UP PUMP WITH SUCTION AND DISCHARGE HOSE.
  2. INSTALL UP-STREAM SANDBAG DAM.
  3. INSTALL DOWN-STREAM SANDBAG DAM.
  4. THE PUMP MUST RUN CONTINUOUSLY WHILE WORKING IN THE STREAM.
  5. STREAMBANKS MUST BE STABILIZED AT THE END OF EACH DAY.

## Solutions for Dewatering: Summary

- **Clean water** does not need to be directed to a sediment control measure, but it needs to outlet to an erosion resistant/energy dissipating surface. For example, clean water may include water diverted from stream or from wells being used to draw down water table) does not need to be treated,
- **Sediment-laden water** needs to be directed to a sediment control measure. For example, any water that has pooled in a disturbed area of a construction site, including ponds, ground water intrusion, rainwater that has pooled on the site, etc.
- Poned water that has a visible sheen, color, odor, or pollutants other than sediment may require additional treatment and another permit prior to discharge. Dewatering operations should cease until pollutant levels are determined
- Intake hose should be floated or placed in a sump pit
- Containment: Sediment Trap, Sediment Basin, Frac Tank
- Filtration: Filter Bag, Treatment Train, Dewatering Tank/Flocculant System
- Outlet onto erosion resistant, energy-dissipating surface

## **Challenges and Solutions: Concrete Washout**

### CSGP Implementation Requirements 3.3(a)(7)

Appropriate measures must be implemented to eliminate wastes or unused building materials including, but limited to garbage, debris, cleaning wastes, wastewater, concrete or cementitious washout water, mortar/masonry products, soil stabilizers, lime stabilization materials, and other substances from being carried from a project site by run-off or wind. Wastes and unused building materials must be managed and disposed of in accordance with all applicable statutes and regulations

### CSGP Appendix B

“Concrete washout” means the rinsing of chutes, pumps, curb and paving machines, hoppers, wheelbarrows, hand tools and any other equipment that are used to handle concrete, mortar, stucco, grout or other mixtures of cement. Concrete washout water is a wastewater slurry containing cementitious materials, metals and is caustic or corrosive, having a high pH.

## Challenges and Solutions: Planning Concrete Washout

Estimating concrete washout volume example

- Pouring foundations and drives that requires 160 yards of concrete
- Given 8 cubic yards/truck, estimate that 20 concrete trucks will be needed
- 20-40 gal washout water per truck
- $40 \text{ gal/truck} \times 20 \text{ trucks} \times 0.13 \times 1.25 = 130 \text{ cubic feet of washout}$
- $130 \text{ cubic feet} = 4.8 \text{ cubic yards of washout}$
- Size your concrete washout containment appropriately

### 710.03 Concrete and Cementitious Washwater Management

EXHIBIT 710.03-J

#### Washwater Containment Design Guidance

Computed by: \_\_\_\_\_ Date: \_\_\_\_\_

Project Name: \_\_\_\_\_

Washwater source:  Concrete  Mortar/masonry  Grout  Flowable fill  Other \_\_\_\_\_

It is highly recommended that plans contain estimates for implementation of containments sufficient to receive the anticipated washwater volumes. Plans must provide sufficient information to construct or implement adequate containments. On-site constructed containments must have construction details, drawings and installation requirements and number of containment units, where necessary, to provide adequate containment of project cementitious washwater necessary to complete the project.

Narrative of cementitious washwater management:

a. Anticipated washwater volume: \_\_\_\_\_

b. Description of containments including size and number (refer to SWP3). \_\_\_\_\_

The following are suggestions for deriving a washwater management plan.

1. Anticipated cubic yards of cementitious plastic state material: \_\_\_\_\_ cubic yards
  - a. Anticipated washwater from ready mixed concrete trucks:
    - i. Average load volume is estimated to be 8 cubic yards of concrete per truck.
    - ii. Number of trucks \_\_\_\_\_ x 20-40 gallons = \_\_\_\_\_ total gallons
    - iii. Total gallons \_\_\_\_\_ x 0.13 cubic feet/gallon x 1.25 (freeboard) = \_\_\_\_\_ cubic feet of washwater containment required with freeboard.
  - b. Anticipated washwater from other cementitious activity \_\_\_\_\_ cubic feet. (mortar/masonry, grout, on-site batch plant, other)
  - c. For residential projects: washwater estimate per house/unit \_\_\_\_\_ cubic feet x \_\_\_\_\_ units = \_\_\_\_\_ total washwater volume to cover residential home construction.
2. Type of containment (not limited to one type):
  - a.  Ready mixed concrete with truck mounted washwater recycling systems.
  - b.  Manufactured unit:
    - i. Size: Length: \_\_\_\_\_ feet Width: \_\_\_\_\_ feet Depth: \_\_\_\_\_ feet
    - ii. Number of units (available as needed) \_\_\_\_\_
  - c.  Modified dumpster: \_\_\_\_\_ size and number of units (available as needed) \_\_\_\_\_
  - d.  One time use (disposable) containments:
    - i. Size/type/product \_\_\_\_\_
    - ii. Number of units (available as needed) \_\_\_\_\_
  - e.  On-site constructed, above grade: \_\_\_\_\_ size and number of units \_\_\_\_\_
  - f.  On-site constructed, below grade: \_\_\_\_\_ size and number of units \_\_\_\_\_  
Justification for use of below grade containment: \_\_\_\_\_
3. Additional information regarding how cementitious washwater will be contained or properly removed from the site. \_\_\_\_\_
